JACOBS UNIVERSITY

MapReduce

Instructor:	Peter Baumann
email:	p.baumann@jacobs-university.de
tel:	-3178
office:	room 88, Research 1

Who Uses MapReduce?

- At Google:
  - Index construction for Google Search
  - Article clustering for Google News
  - Statistical machine translation
- At Yahoo!:
  - “Web map” powering Yahoo! Search
  - Spam detection for Yahoo! Mail
- At Facebook:
  - Data mining
  - Ad optimization

MapReduce: the concept

Credits:

- David Maier
- Google
- Shiva Teja Reddi Gopidi

Programming Model

- Goals: large data sets, processing distributed over 1,000s of nodes
  - Abstraction to express simple computations
  - Hide details of parallelization, data distribution, fault tolerance, load balancing
    - MapReduce engine performs all housekeeping
- Inspired by primitives from functional PLs like Lisp, Scheme, Haskell
- Input, output are sets of key/value pairs
- Users implement interface of two functions:

```
map (inKey, inValue) -> (outKey, intermediateValuelist )
```

aka „group by“ in SQL

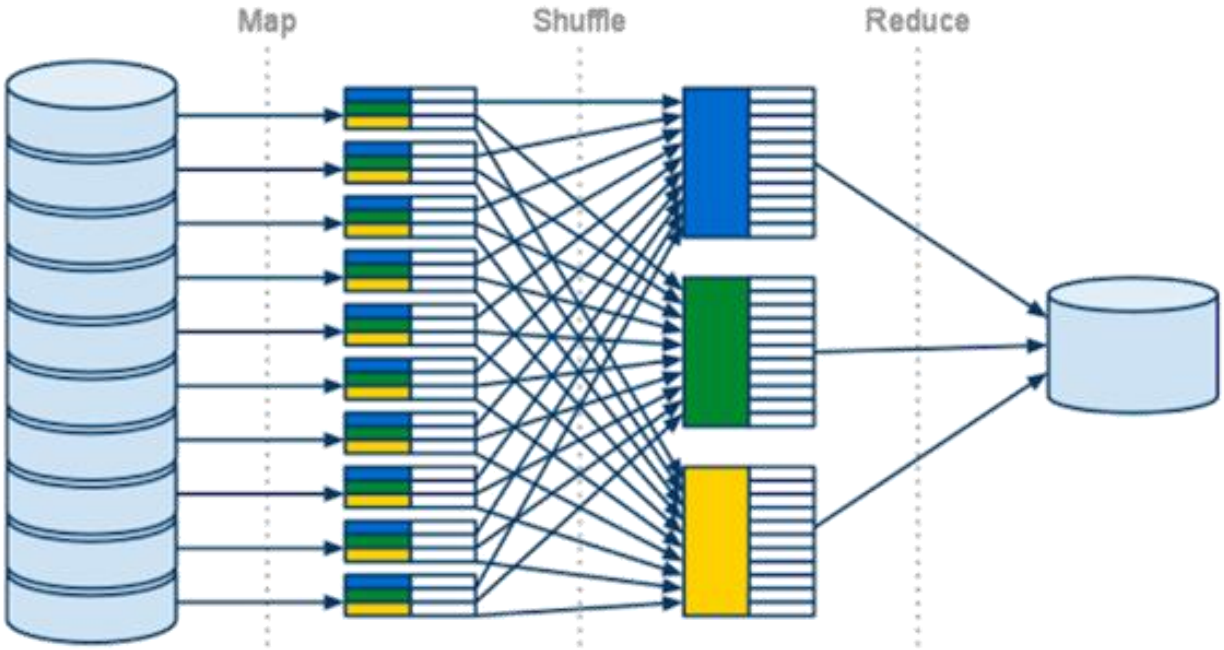
```
reduce(outKey, intermediateValuelist) -> outValuelist
```

aka aggregation in SQL

Ex 1: Count Word Occurrences

```
map(String inKey, String inValue):
  // inKey: document name
  // inValue: document contents
  for each word w in inValue:
    EmitIntermediate(w, "1");
```

```
reduce(String outputKey, Iterator auxValues):
  // outKey: a word
  // outValues: a list of counts
  int result = 0;
  for each v in auxValues:
    result += ParseInt(v);
 Emit( AsString(result) );
```



[image: Google]

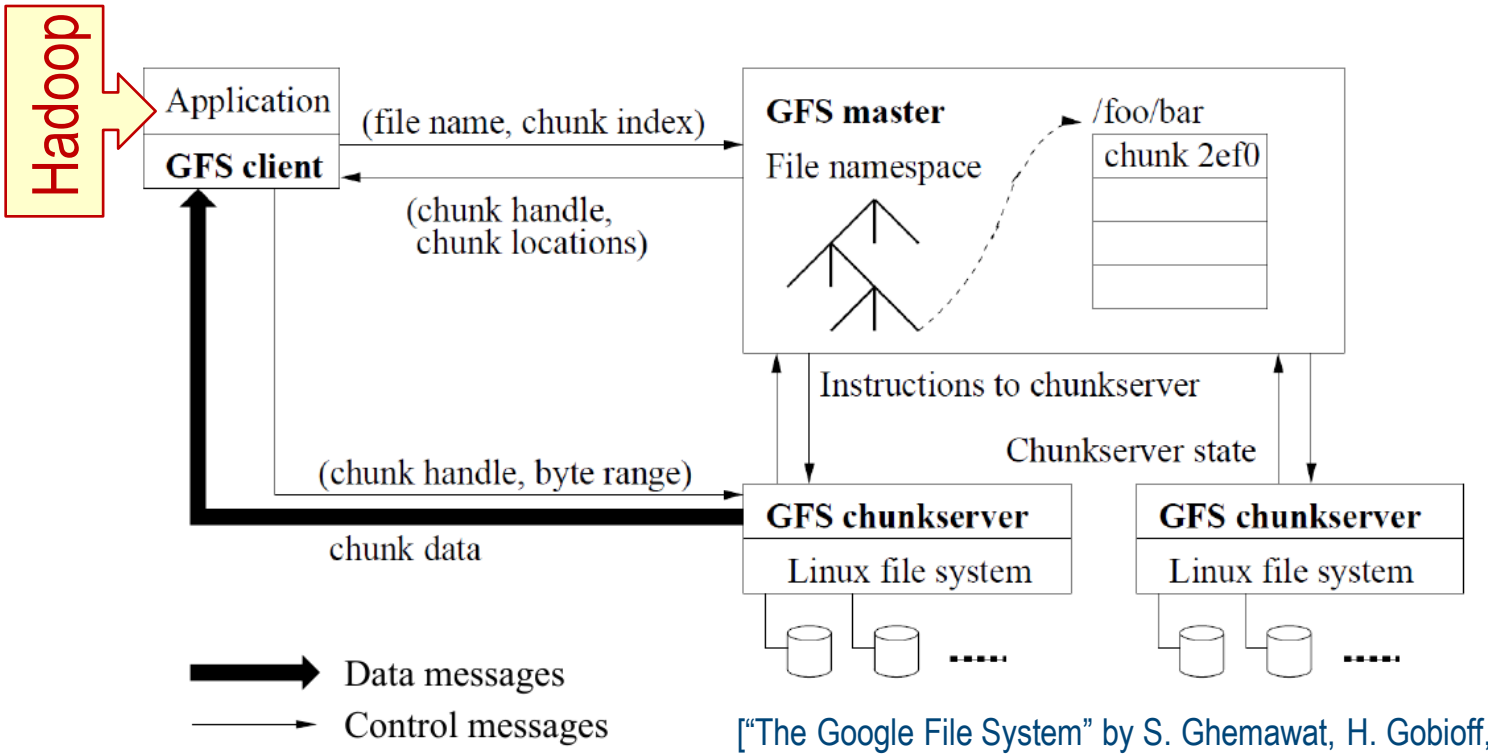
Hadoop: a MapReduce implementation

Credits:

- David Maier, U Wash
- Costin Raiciu
- “The Google File System” by S. Ghemawat, H. Gobioff, and S.-T. Leung, 2003
- https://hadoop.apache.org/docs/r1.0.4/hdfs_design.html

Hadoop Distributed File System

- HDFS = scalable, fault-tolerant file system
  - modeled after Google File System (GFS)
  - 64 MB blocks („chunks“)



["The Google File System" by S. Ghemawat, H. Gobioff, and S.-T. Leung, 2003]

GFS

- Goals:
  - Many inexpensive commodity components – failures happen routinely
  - Optimized for small # of large files (ex: a few million of 100+ MB files)
- relies on local storage on each node
  - parallel file systems: typically dedicated I/O servers (ex: IBM GPFS)
- metadata (file-chunk mapping, replica locations, ...) in master node‘s RAM
  - Operation log on master‘s local disk, replicated to remotes → master crash recovery!
  - „Shadow masters“ for read-only access

HDFS differences?
- No random write; append only
- Implemented in Java, emphasizes platform independence
- terminology: namenode → master, block → chunk, ...

Hadoop Job Management Framework

- JobTracker = daemon service for submitting & tracking MapReduce jobs
- TaskTracker = slave node daemon in the cluster accepting tasks (Map, Reduce, & Shuffle operations) from a JobTracker

Discussion:

- Pro: replication & automated restart of failed tasks
  → highly reliable & available
- Con: 1 Job Tracker per Hadoop cluster, 1 Task Tracker per slave node
  → single point of failure

Discussion

- MapReduce concept:
  - One-input two-stage data flow extremely rigid
  - Most suitable for independent data
    - *Good: word count*
    - *Not optimal: join, graphs, arrays, ...*
  - HDFS assumes shared-nothing & locality, but datacenters often run SANs
  - (Well-known) algorithms need cumbersome rewriting = special-skill programming
    - *Query frontends: Pig Latin, Hive, etc.*
  - map(), reduce() procedural Java code
    → hard to optimize
- Hadoop implementation:
  - All intermediate data communicated via disk
  - Task scheduler: central point of failure
  - HDFS not standards conformant (eg, POSIX)

JACOBS UNIVERSITY

Query Languages for MapReduce

Credits:

- Matei Zaharia

Motivation

- MapReduce is powerful
  - many algorithms can be expressed as a series of MR jobs
- But fairly low-level
  - must think about keys, values, partitioning, etc.
- Can we capture common “job patterns”?
  - Like eg SQL does

Pig

- Started at Yahoo! Research
  - Runs about 50% of Yahoo!'s jobs
- Features:
  - Expresses sequences of MapReduce jobs
  - Data model: nested "bags" of items
  - Provides relational (SQL) operators (JOIN, GROUP BY, etc)
  - Easy to plug in Java functions

Example Problem

- user data in one file
- website data in another
- find top 5 most visited pages
- by users aged 18-25

}
```

[http://wiki.apache.org/pig-data/attachments/PigTalksPapers/attachments/ApacheConEurope09.ppt]

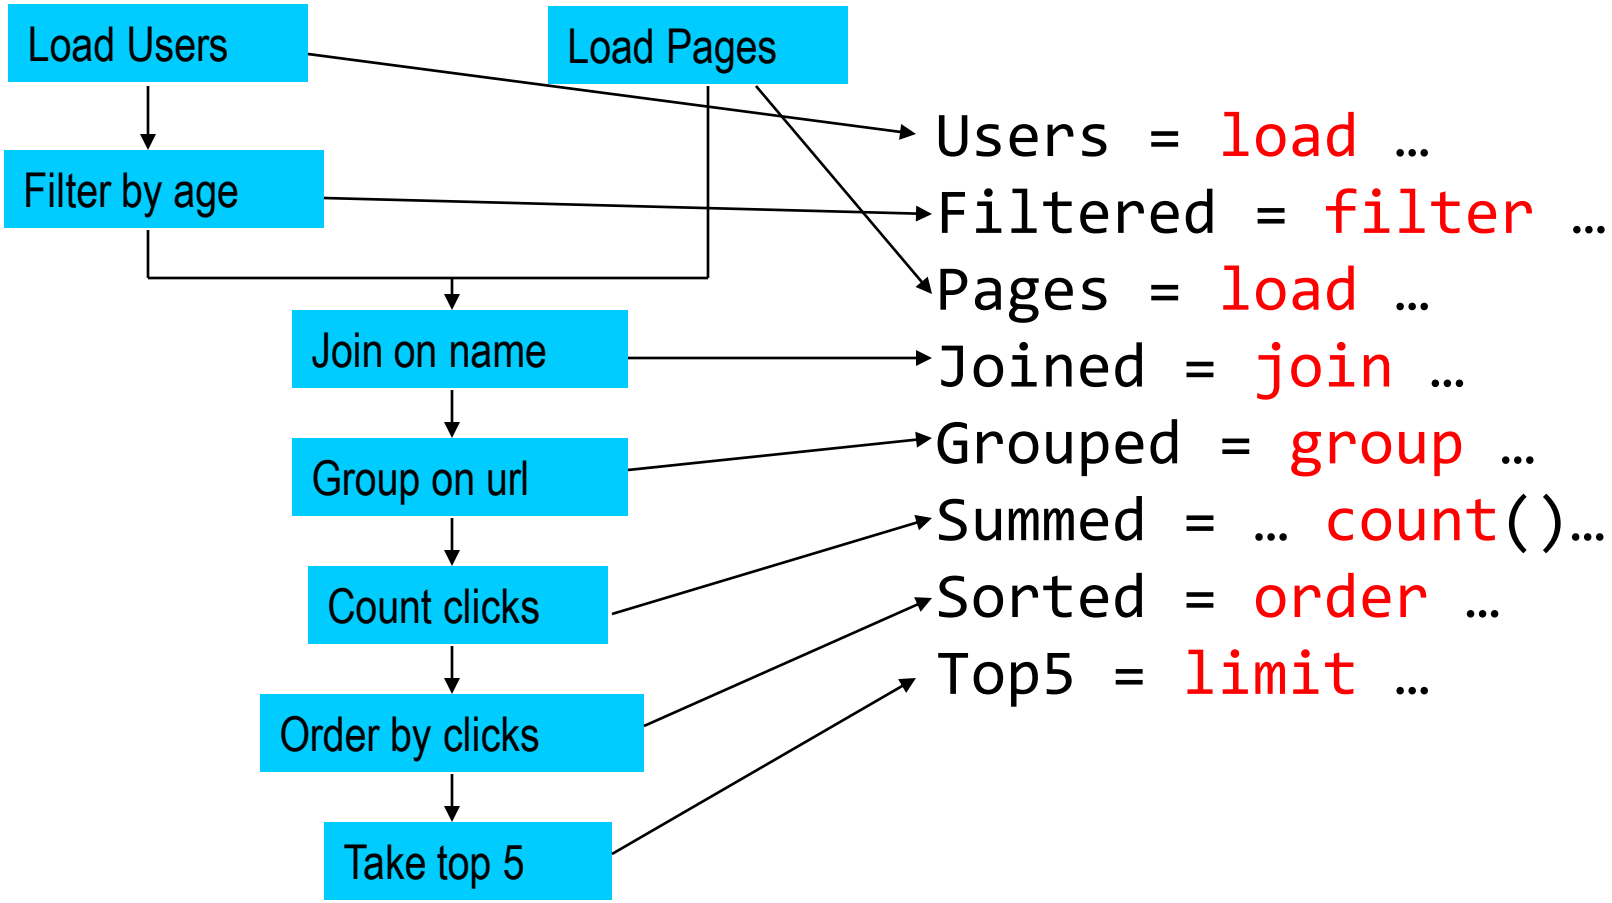
In Pig Latin

```
Users    = load 'users' as (name, age);
Filtered = filter Users by
                  age >= 18 and age <= 25;
Pages    = load 'pages' as (user, url);
Joined   = join Filtered by name, Pages by user;
Grouped  = group Joined by url;
Summed   = foreach Grouped generate group,
                   count(Joined) as clicks;
Sorted   = order Summed by clicks desc;
Top5     = limit Sorted 5;

store Top5 into 'top5sites';
```

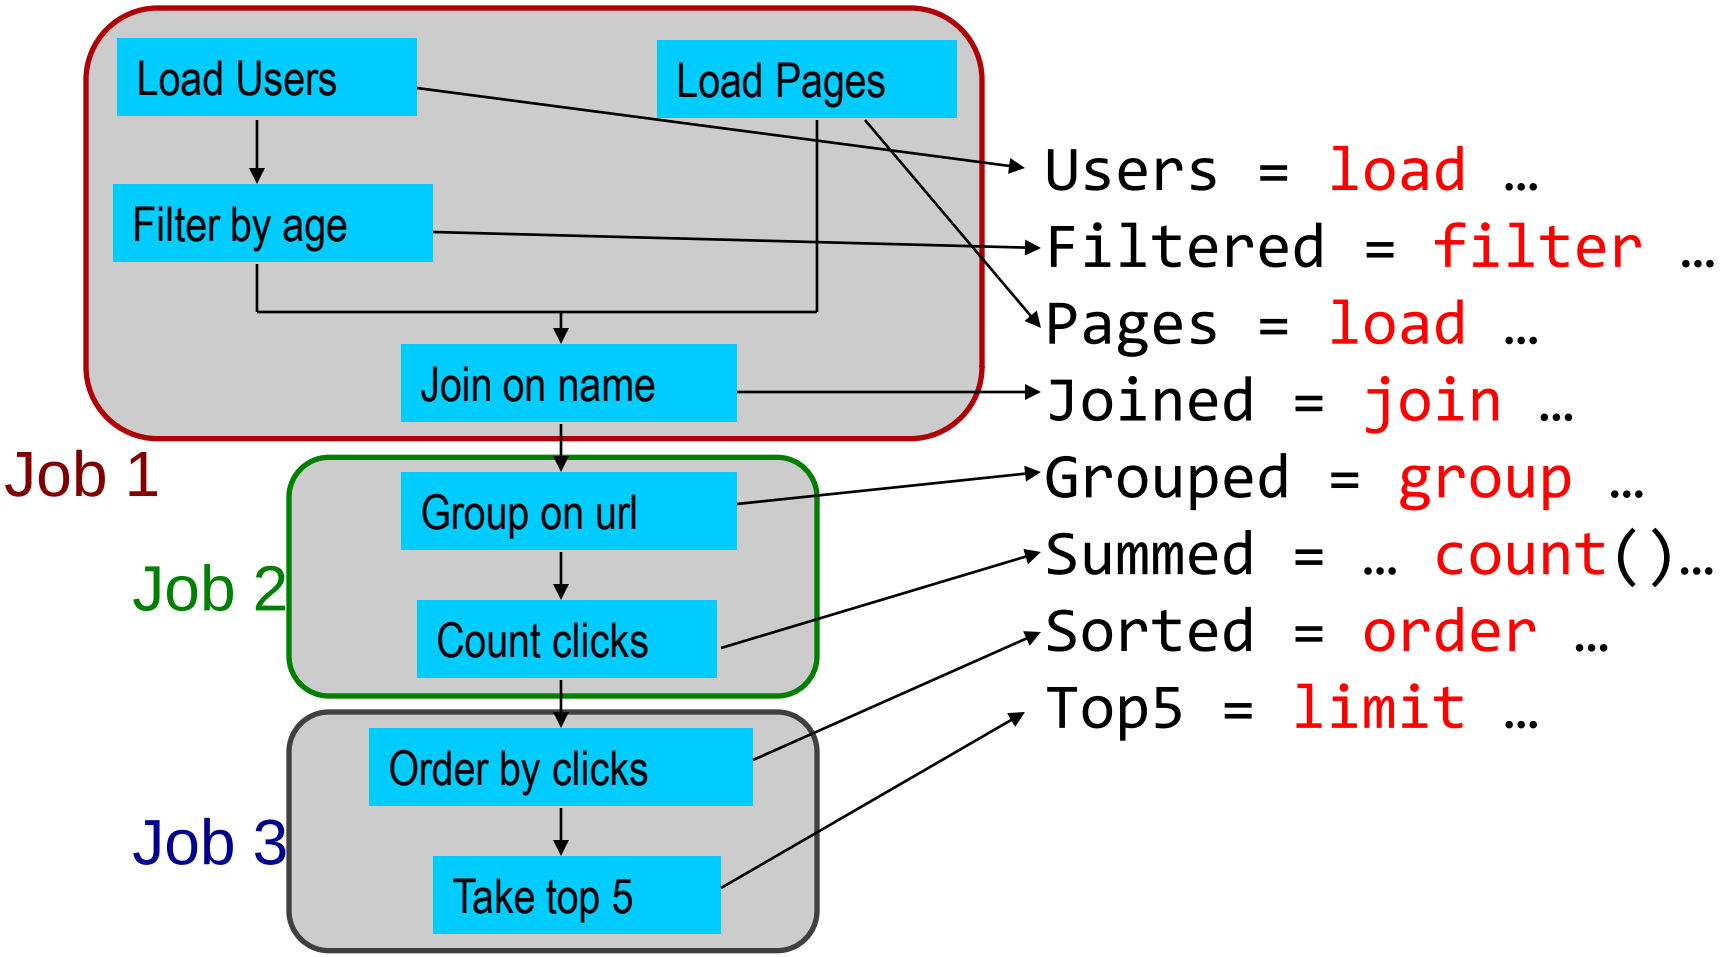
Translation to MapReduce

Quite natural translation of job components into Pig Latin:



Translation to MapReduce

Quite natural translation of job components into Pig Latin:



Hive

- Relational database built on Hadoop
  - table schemas, SQL-like query language

```
SELECT word, count(1) AS count
FROM  (SELECT explode(split(line, '\s')) AS word
       FROM docs) temp
GROUP BY word
ORDER BY word
```

  - can call Hadoop Streaming scripts
- Common relational features:
  - table partitioning,complex data types, sampling
  - some query optimization
- Developed at Facebook, now Apache
  - Today: „data warehouse infrastructure“

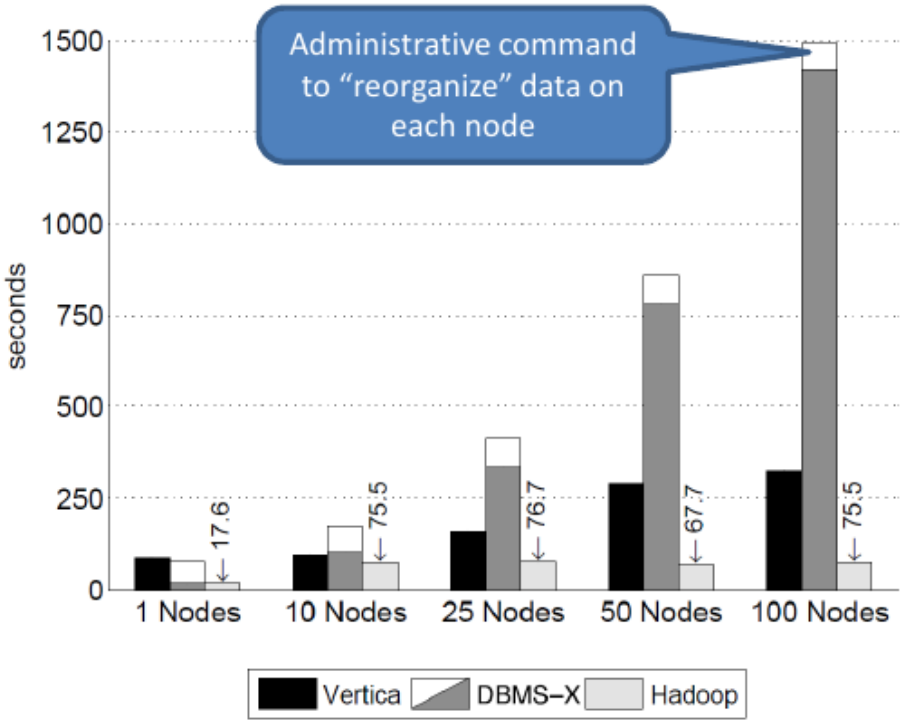
MapReduce vs (Relational) Databases

Credits: David Maier

Grep Task: Load – *How Well Does It Scale?*

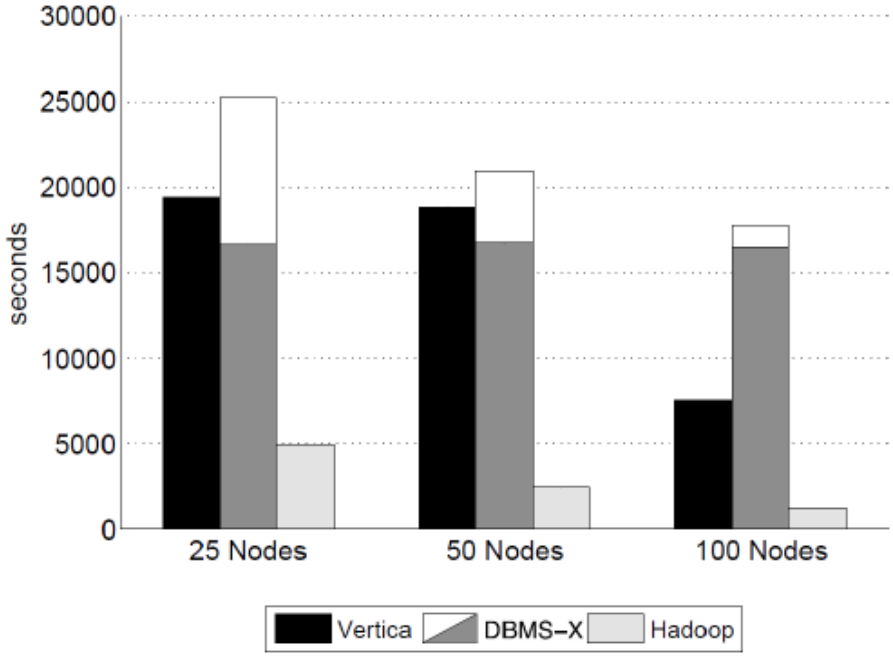
535 MB/node

fixed data size per node
varies volume



1 TB/cluster

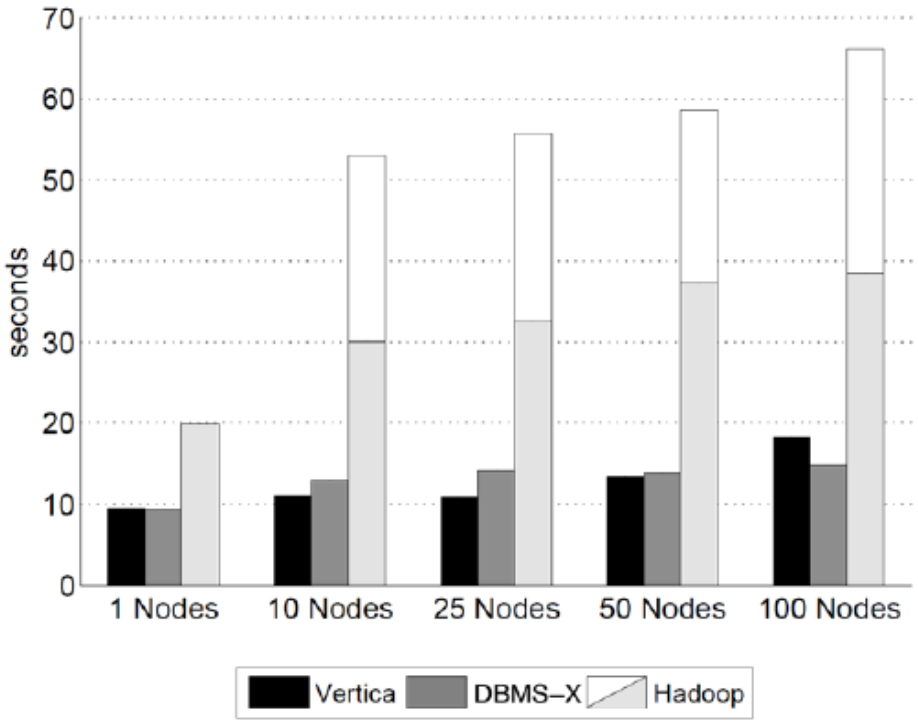
fixed total dataset size,
evenly divided amongst nodes



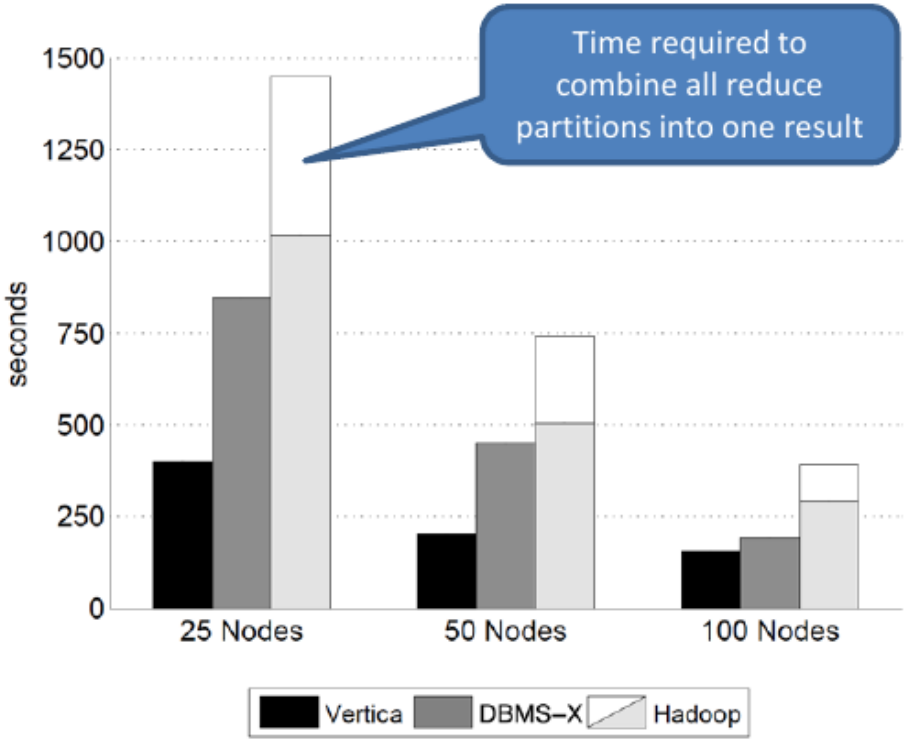
["A Comparison of Approaches to Large-Scale Data Analysis" by A. Pavlo et al., 2004]

Grep Task: Execution Times

535 MB/node



1 TB/cluster



["A Comparison of Approaches to Large-Scale Data Analysis" by A. Pavlo et al., 2004]

MapReduce Criticism

- Efficiency
  - master makes O(M + R) scheduling decisions
  - master stores O(M * R) states in memory
- Features
  - No built-in indexing, schema, no schema, no high-level language
- “Why not use a parallel DBMS instead?”
  - map/reduce is a “giant step backwards”
  - not novel at all
  - does not provide features of traditional DBMS
  - incompatible with DBMS tools
  - ...but fault tolerance – homework for DBMSs!

Summary: MapReduce vs Parallel (R)DBMS

- MapReduce: No schema, no index, no high-level language
  - faster loading vs. faster execution
  - easier prototyping vs. easier maintenance
- Fault tolerance
  - restart of single worker vs. restart of transaction
- Installation and tool support
  - easy to setup map/reduce vs. challenging to configure parallel DBMS
  - no tools for tuning vs. tools for automatic performance tuning
- Performance per node
  - results seem to indicate that parallel DBMS achieve same performance as map/reduce in smaller clusters

In a nutshell:
- (R)DBMSs: efficiency, QoS
- MapReduce: cluster scalability

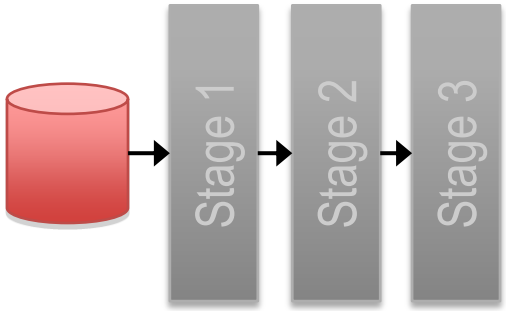
Spark: improving Hadoop

Credits:

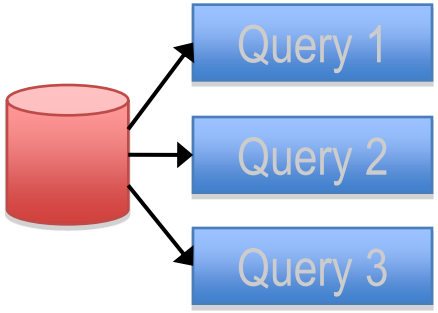
- Matei Zaharia

Motivation

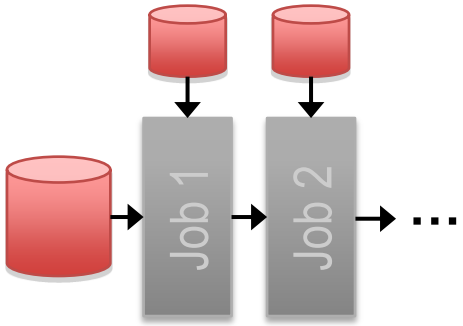
- MapReduce aiming at “big data” analysis on large, unreliable clusters
  - After initial hype, shortcomings perceived:
    ease of use (programming!), efficiency, tool integration, ...
- …as soon as organizations started using it widely, users wanted more:
  - More complex, multi-stage applications
  - More interactive queries
  - More low-latency online processing



Iterative job



Interactive mining



Stream processing

Spark vs Hadoop

- Spark = cluster-computing framework by Berkeley AMPLab
  - Now Apache
- Inherits HDFS, MapReduce from Hadoop
- But:
  - Disk-based comm → in-memory comm
  - Java → Scala

Resilient Distributed Datasets (RDDs)

- Partitioned collections of records
  that can be stored in memory across the cluster
- Manipulated through a diverse set of transformations
  - *map*, *filter*, *join*, etc
- Fault recovery without costly replication
  - Remember series of transformations that built RDD (its *lineage*)
  - Can recompute lost data based on input files

Example: Log Mining

- Load error messages from a log into memory, then interactively search for various patterns

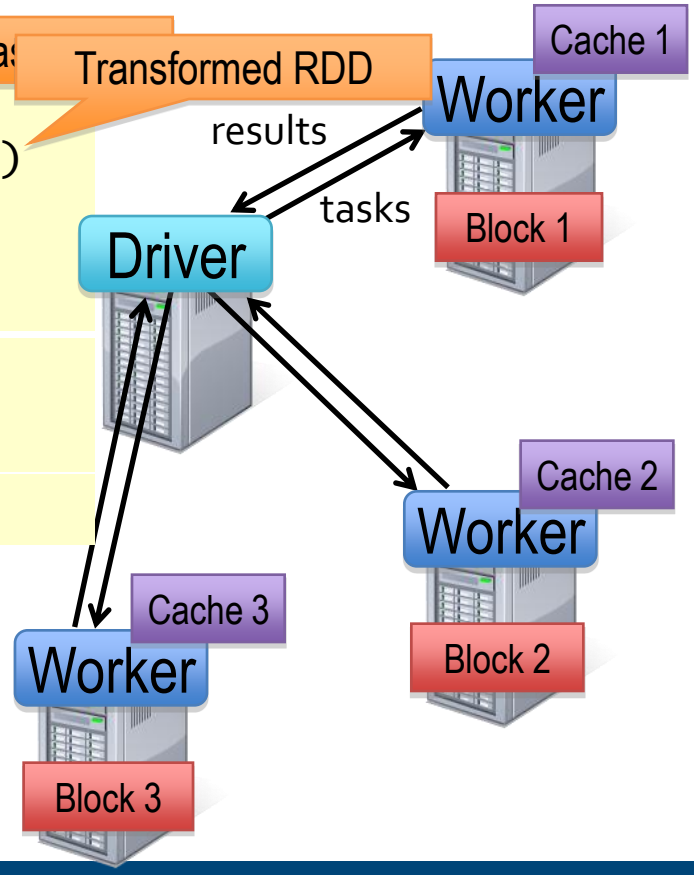
```
lines = spark.textFile("hdfs://...")
errors = lines.filter(_.startsWith("ERROR"))
messages = errors.map(_.split('\t')(2))
messages.cache()
```

```
messages.filter(_.contains("foo")).count
messages.filter(_.contains("bar")).count
```

```
. . .
```

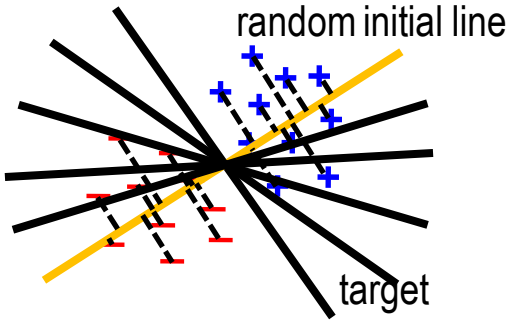
Scala programming language

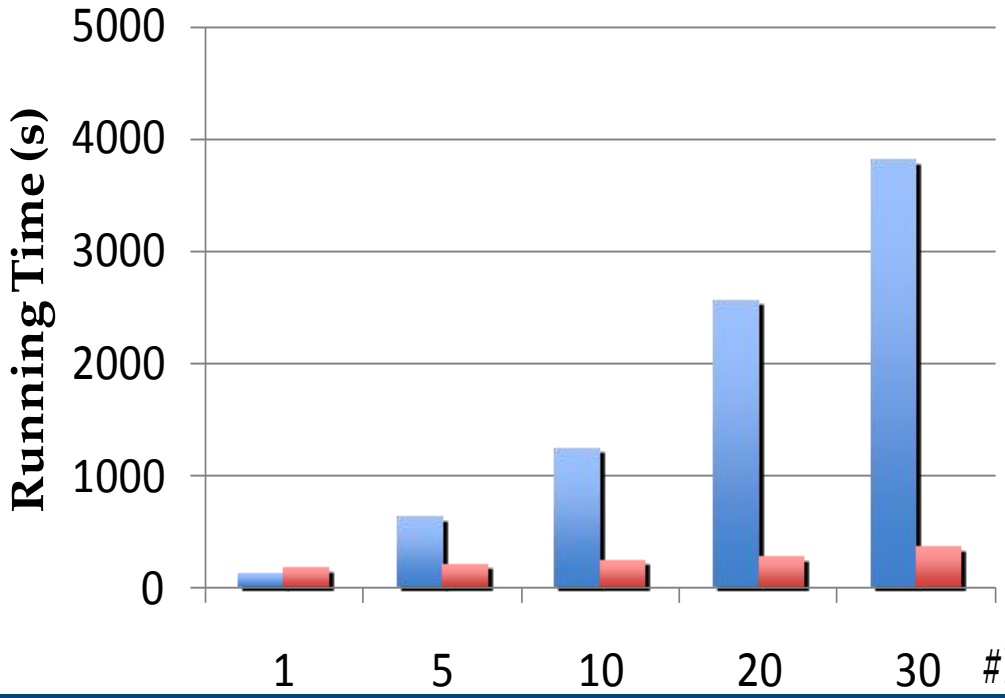
1 TB data in 5-7 sec (vs 170 sec on disk)



Ex: Logistic Regression Performance

- Find best line separating two sets of points
- 29 GB dataset
- 20x EC2 m1.xlarge 4-core machines
- Result:





127 s / iteration

Hadoop

Spark

first iteration 174 s
further iterations 6 s

Conclusion

Conclusion

- MapReduce = specialized (synchronous) distributed processing paradigm
  - Optimized for horizontal scaling in commodity clusters (!), fault tolerance
  - Efficiency? Hardware, energy, ... (see [0], [1], [2], [3] etc.)
    - *"Adding more compute servers did not yield significant improvement"* [src]
  - Well suited for sets, less so for highly connected data (graphs, arrays)
  - Need to rewrite algorithms
- Apache Hadoop = MapReduce implementation (HDFS, Java)
- Apache Spark = improved MapReduce implementation (HDFS, DSS, Scala)
- Query languages on top of MapReduce
  - HLQLs: Pig, Hive, JAQL, ASSET, …
