

OS 2022 Class Problem Sheet #5

Problem 5.1: *game hacking code injection*

(5 points)

In Ubuntu/Debian systems, you can install classic text-based games (`sudo apt-get install bsdgames`) that can be played in a terminal session. Pick one of the games and try to change its behaviour by writing a `gamehack` shared library that can be preloaded to change the game. You are not allowed to make changes to the game source code itself.
